Important information

Textbook

Rick Szeliski, *Computer Vision: Algorithms and Applications* online at: <http://szeliski.org/Book/>

Many of the slides in this course are modified from the excellent class notes of similar courses offered in other schools by Noah Snavely, Prof Yung-Yu Chuang, Fredo Durand, Alyosha Efros, Bill Freeman, James Hays, Svetlana Lazebnik, Andrej Karpathy, Fei-Fei Li, Srinivasa Narasimhan, Silvio Savarese, Steve Seitz, Richard Szeliski, and Li Zhang. The instructor is extremely thankful to the researchers for making their notes available online. Please feel free to use and modify any of the slides, but acknowledge the original sources where appropriate.

All readings are from Richard Szeliski, *Computer Vision: Algorithms and Applications*, 2nd Edition, unless otherwise noted.

Reading

- Szeliski 7.2

Edge detection

- Convert a 2D image into a set of curves
 - Extracts salient features of the scene
 - More compact than pixels

Origin of edges

- Edges are caused by a variety of factors

Images as functions...

- Edges look like steep cliffs

Characterizing edges

- An edge is a place of *rapid change* in the image intensity function

Image derivatives

- How can we differentiate a *digital* image $F[x,y]$?
 - Option 1: reconstruct a continuous image, f , then compute the derivative
 - Option 2: take discrete derivative (finite difference)

$$\frac{\partial f}{\partial x}[x, y] \approx F[x + 1, y] - F[x, y]$$

How would you implement this as a linear filter?

$$\frac{\partial f}{\partial x} \cdot \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array}$$

H_x

$$\frac{\partial f}{\partial y} \cdot \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array}$$

H_y

Image gradient

- The *gradient* of an image: $\nabla f = \left[\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$

The gradient points in the direction of most rapid increase in intensity

The *edge strength* is given by the gradient magnitude:

$$\|\nabla f\| = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

The gradient direction is given by:

$$\theta = \tan^{-1} \left(\frac{\partial f}{\partial y} / \frac{\partial f}{\partial x} \right)$$

- how does this relate to the direction of the edge?

Image gradient

Effects of noise

Noisy input image

$$f(x)$$

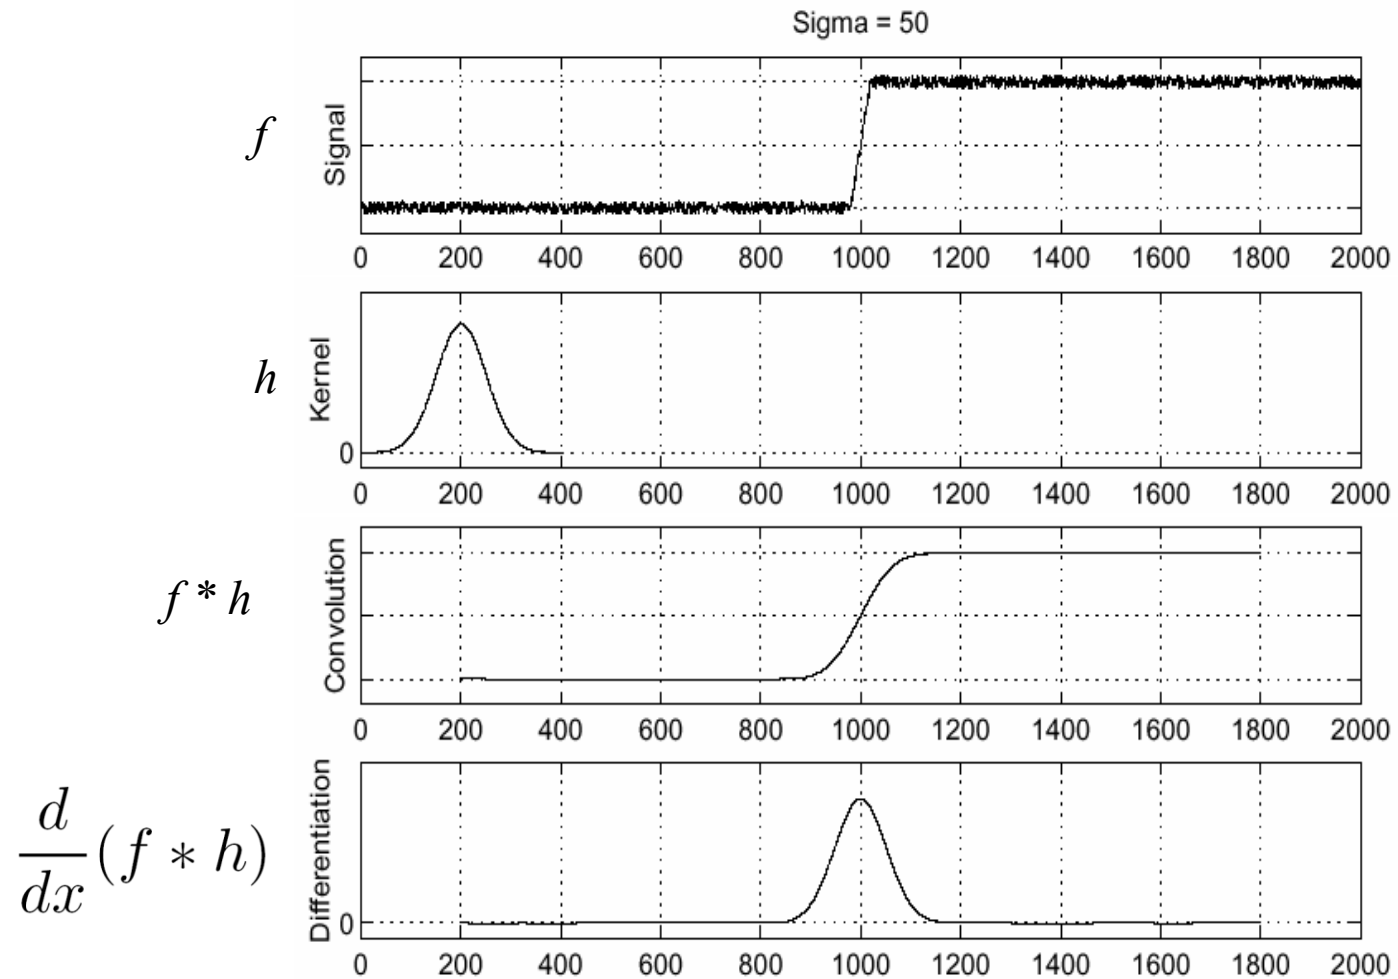

$$\frac{d}{dx}f(x)$$

Where is the edge?

Solution: smooth first

To find edges, look for peaks in $\frac{d}{dx}(f * h)$

Associative property of convolution

- Differentiation is convolution, and convolution is associative: $\frac{d}{dx}(f * h) = f * \frac{d}{dx}h$

- This saves us one operation: f

The 1D Gaussian and its derivatives

$$G_{\sigma}(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{x^2}{2\sigma^2}}$$

$$G'_{\sigma}(x) = \frac{d}{dx} G_{\sigma}(x) = -\frac{1}{\sigma} \left(\frac{x}{\sigma} \right) G_{\sigma}(x)$$

2D edge detection filters

Gaussian

$$h_{\sigma}(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{2\sigma^2}}$$

derivative of Gaussian (x)

$$\frac{\partial}{\partial x} h_{\sigma}(u, v)$$

Derivative of Gaussian filter

x-direction

y-direction

The Sobel operator

- Common approximation of derivative of Gaussian

$$\frac{1}{8} \begin{array}{|c|c|c|} \hline -1 & 0 & 1 \\ \hline -2 & 0 & 2 \\ \hline -1 & 0 & 1 \\ \hline \end{array}$$

s_x

$$\frac{1}{8} \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

s_y

- The standard definition of the Sobel operator omits the $1/8$ term
 - doesn't make a difference for edge detection
 - the $1/8$ term **is** needed to get the right gradient magnitude

Sobel operator: example

Source: Wikipedia

Image with Edge

Edge Location

Image + Noise

Derivatives detect
edge *and* noise

Smoothed derivative removes
noise, but blurs edge

Example

original image

Finding edges

smoothed gradient magnitude

Finding edges

where is the edge?

thresholding

Get Orientation at Each Pixel

- Get orientation (below, threshold at minimum gradient magnitude)

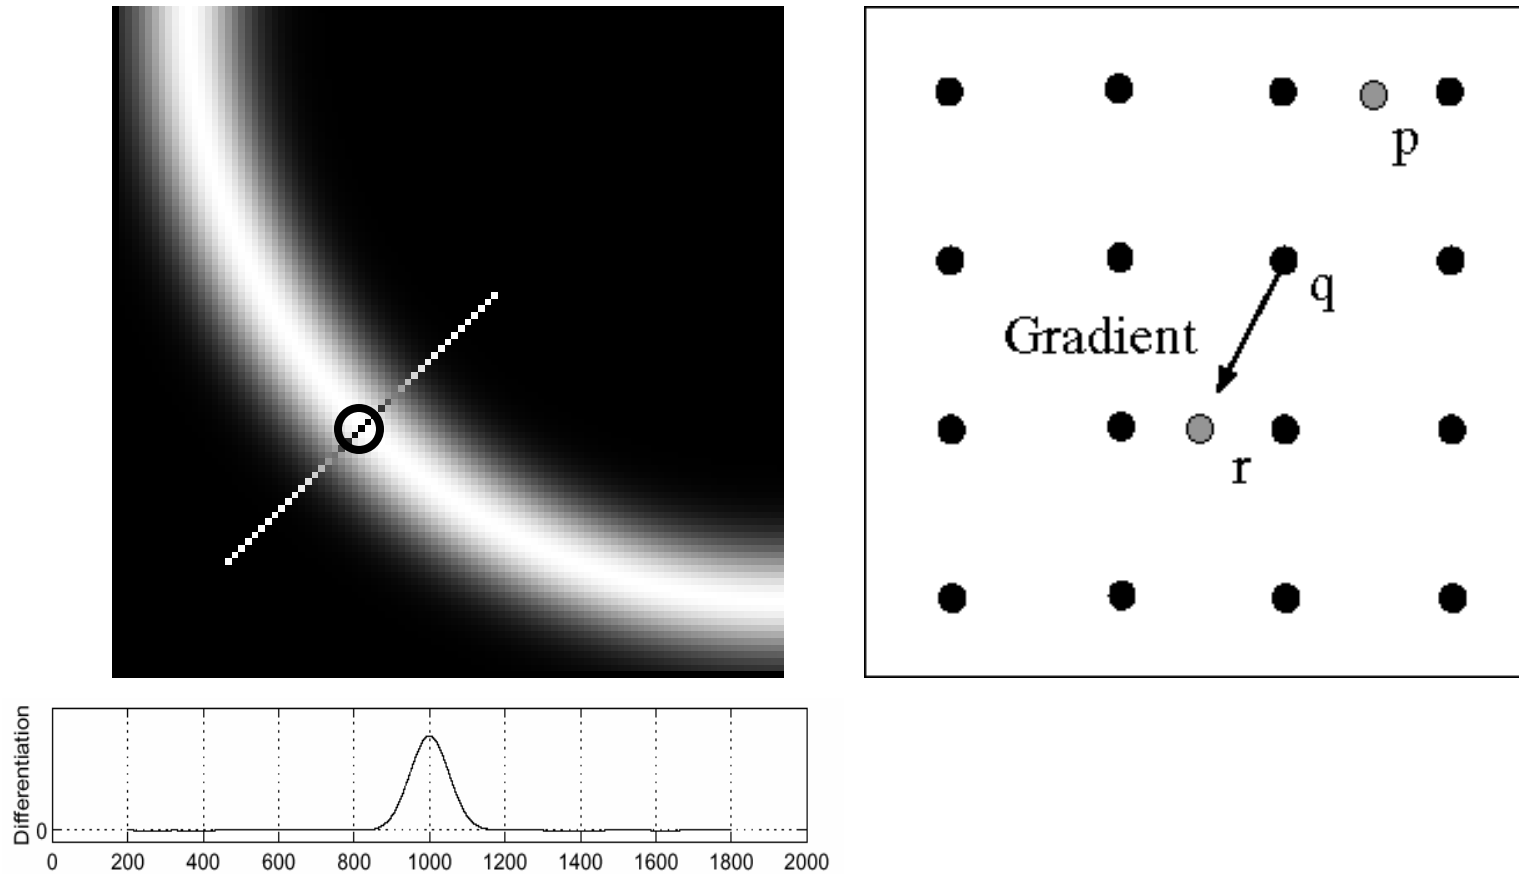

$$\theta = \text{atan2}(g_y, g_x)$$

360

Gradient orientation angle

0

Non-maximum suppression

- Check if pixel is local maximum along gradient direction
 - requires *interpolating* pixels p and r

Before Non-max Suppression

After Non-max Suppression

Thresholding edges

- Still some noise
- Only want strong edges
- 2 thresholds, 3 cases
 - $R > T$: strong edge
 - $R < T$ but $R > t$: weak edge
 - $R < t$: no edge
- Why two thresholds?

Connecting edges

- Strong edges are edges!
- Weak edges are edges iff they connect to strong
- Look in some neighborhood (usually 8 closest)

Canny edge detector

MATLAB: `edge(image, 'canny')`

1. Filter image with derivative of Gaussian

3. Non-maximum suppression

4. Linking and thresholding (hysteresis):

- Define two thresholds: low and high
- Use the high threshold to start edge curves and the low threshold to continue them

Canny edge detector

- Our first computer vision pipeline!
- Still a widely used edge detector in computer vision

J. Canny, [**A Computational Approach To Edge Detection**](#), IEEE Trans. Pattern Analysis and Machine Intelligence, 8:679-714, 1986.

- Depends on several parameters:
 - high threshold
 - low threshold
 - σ : width of the Gaussian blur

Canny edge detector

original

Canny with $\sigma = 1$

Canny with $\sigma = 2$

- The choice of σ depends on desired behavior
 - large σ detects "large-scale" edges
 - small σ detects fine edges

Scale space [Witkin 83]

- Properties of scale space (w/ Gaussian smoothing)
 - edge position may shift with increasing scale (σ)
 - two edges may merge with increasing scale
 - an edge may **not** split into two with increasing scale
